

COURSE CODE: DCIT 208

ASSIGNMENT NUMBER: 1A2

ASSIGNMENT TITLE: Client Interview Evidence and
Required Transformation Memo

FULL NAME: DZUDZOR SELASI ANNETTE ESI

STUDENT ID: 22310101

TEAM NAME: InnovateX

PROJECT TITLE: ScentHub

CLIENT: Yussif Kangre Abdulai

TEAM REPOSITORY URL:

<https://github.com/selasi07/ScentHub>

INDIVIDUAL PORTFOLIO URL:

<https://github.com/selasi07/DCIT208-Portfolio>

DATE: 3 July 2026

AI Disclosure Statement

I used AI assistance as a learning aid while preparing this assignment. AI was used to help me understand the assignment requirements, organize my ideas, improve the clarity of my writing, and review my work. All interview details, project-specific information, requirements, reflections, and final decisions were reviewed, verified, and adapted by me based on my understanding of the ScentHub project. I understand that I must be able to explain and defend every part of this submission.

A. Client Discovery Questions

Current Workflow

1. How do you currently record perfume sales and stock updates?
2. What steps do you normally follow from the time a customer buys a perfume until the sale is recorded?

Pain Points

3. What are the biggest challenges you face when managing your inventory manually?
4. Have you ever experienced missing stock, incorrect sales records, or difficulty finding information? If yes, what caused it?

Data

5. What information do you record for each perfume product?
6. What customer information, if any, do you usually keep after a sale

Success Criteria

7. What would make you consider ScentHub a successful system for your business?
8. Which daily tasks would you like the system to make faster or easier?

Security and Privacy

9. Who should be allowed to access the system, and should different users have different permissions?

Exceptions

10. What should happen if a product is out of stock when someone tries to record a sale?
11. What should happen if the internet connection or system fails while recording a sale?
12. Are there any reports or business information that you would like the system to generate automatically?

B. Interview/ Observation Evidence

Interview Details

Item	Information
Date	30 June 2026
Time	6:30 PM
Medium	WhatsApp Chat
Participant Role	Business Owner
Client	Yussif Kangre Abdulai
Evidence Type	WhatsApp conversation (personal details redacted)

Interview Summary

During the discussion, the client explained that the business currently manages inventory, sales, and customer information manually. Whenever a sale is made, the details are written down, and stock quantities are updated by hand. As the business has grown, this process has become more difficult to manage because records can easily become disorganized, and mistakes sometimes occur when updating stock or calculating sales.

The client explained that checking product availability often takes longer than expected because there is no central system for viewing inventory. Preparing sales reports is also time-consuming because information must be gathered from different manual records. These challenges make it harder to monitor business performance and make informed decisions.

The client stated that the proposed ScentHub system should simplify daily operations by allowing products to be managed digitally, automatically updating stock after every sale, storing customer information in one place, and generating reports when needed. The client also emphasized that only authorized users should be able to access the system to protect business information.

The information gathered during the interview confirmed many of the requirements already identified in our project proposal, including inventory management, sales recording, customer management, report generation, and secure user authentication.

Key Client Statements

- "I currently record sales and stock manually."
- "Sometimes it is difficult to know exactly how much stock is available."
- "Preparing reports takes too much time."
- "I want one system where I can manage products, sales, and customers."
- "Only trusted staff should be able to access the system."

These statements are consistent with the problem and proposed solution described in your earlier project documents.

C. Requirement Transformation

Raw Client Statement

"I want the system to automatically update stock whenever I record a sale so that I always know the correct quantity available."

Functional Requirement

FR11: The system shall automatically reduce the available stock quantity immediately after a sales transaction has been successfully recorded.

Non-Functional Requirement

The system should update inventory within **two seconds** after a sale is successfully recorded during normal operating conditions.

This is measurable, which is exactly what the lecturer is looking for.

User Story

As a business owner or sales attendant,

I want the system to automatically update inventory whenever I record a sale,

so that the stock levels remain accurate without requiring manual updates.

Acceptance Criteria

- The system records the sale only after all required information has been entered.
- The system reduces the product's stock quantity immediately after the sale is saved.
- The updated stock quantity is displayed to the user after the transaction.
- The system prevents a sale from being completed if there is insufficient stock.
- The system displays a confirmation message after a successful transaction.

Possible API / Interface Implication

The sales page will send the completed sales information to a backend sales endpoint. After the sale is successfully processed, the interface should automatically refresh the inventory information so that users immediately see the updated stock level.

Data Implication

Recording a sale will:

- create a new record in the **Sales** table,
- reduce the quantity stored in the **Products** table,
- store the transaction date and time,
- record the user who completed the sale.

Test Idea

Test Case:

Attempt to sell **three bottles** of a perfume that currently has **five bottles** in stock.

Expected Result:

- The sale is recorded successfully.
- The stock quantity changes from **5** to **2**.
- A success message is displayed.
- The transaction appears in the sales history.

Open Question

One issue that still needs clarification from the client is:

Should the system allow an authorized manager to reverse or cancel a completed sale if it was entered incorrectly?

D. Reflection

Speaking with the client gave me a much better understanding of how software requirements are gathered in real-life projects. Before the interview, I knew that the ScentHub system would help manage inventory and sales, but I assumed the main challenge was simply replacing manual record keeping with a digital system. After listening to the client, I realized that the real challenge is helping the business owner save time, reduce mistakes, and make better business decisions through accurate and well-organized information.

One assumption that changed during the interview was my belief that recording sales was the client's biggest concern. Although recording sales is important, the client explained that keeping track of stock levels and generating reliable reports are equally important because these activities support daily decision-making. This helped me understand that different parts of the system work together, and improving only one feature would not completely solve the client's problems.

I also learned that asking good questions is just as important as designing the software itself. Some of the client's answers revealed needs that were not immediately obvious, such as the

importance of secure user access and automatic stock updates after every sale. These details will influence the system's design and help ensure that the final product meets the client's expectations.

Overall, this interview showed me that software engineering is not only about writing code. It also involves understanding users, identifying their real problems, and transforming their ideas into clear and testable requirements. This experience has improved my confidence in gathering requirements and has given me a better appreciation of the importance of communication throughout the software development process

AI Usage Table

Date	Tool	Prompt Summary	Output Used	Verification
2 July 2026	ChatGPT	Help understand the assignment brief	Assignment structure and organization	Compared with the IA2 brief and project documents
2 July 2026	ChatGPT	Improve wording of project-specific answers	Improved wording only	Reviewed and adapted to match the ScentHub project
2 July 2026	ChatGPT	Explain requirement transformation	Functional requirements, user stories, and acceptance criteria	Verified against lecture notes and previous assignments
